o I lange p s nobel c b osmond and h ziegler growth development and reproductive success of individual plants
depend on the interaction within tolerance limits of the factors in the physical chemical and biological environment
the first two volumes of this series addressed features of the physical environment vol 12a and the special responses
of land plants as they relate to water use and carbon dioxide assimilation vol 12b in this volume we consider specific
aspects of the chemical and biological environment and whereas the previous volumes were primarily concerned with
the atmospheric interactions our emphasis here shifts very much to the soil this complex medium for plant growth
was briefly reviewed in chapter 17 volume 12a since it is difficult to determine the precise physical and chemical
interactions in the soil it is even more difficult to determine the important biological interactions among organisms
nevertheless there is growing awareness of the significance of these interactions and their effects on physiological
processes in the individual plant

this report presents methods for assessing the potential biophysical and socioeconomic impacts of climate change at
scales relevant to forest based communities the methods are tested and demonstrated by estimating such impacts
for the community of vanderhoof british columbia first spatially referenced climate histories and climate scenarios are
developed for a 200 km 200 km study area surrounding vanderhoof second these climate data are linked to new
models and methods for projecting changes in productivity species and wildfire risk under conditions of climate
change third methods for linking changes in productivity to potential changes in harvest rate and then to potential

changes in aggregate household income are developed and applied finally an approach for linking presenting and comparing the results from the various methods is presented this approach takes account of both climate change and parallel socioeconomic changes occurring in a communitys external environment and acknowledges the inherent uncertainty in climate and socioeconomic scenarios the approach is based on the development of multitiered scenario radar maps which are then compressed into a single radar map providing a concise summary of potential climate impacts on a particular community the assessment of community vulnerability tends to be specific to a particular location nevertheless the vanderhoof case study highlights areas where forest based communities may be uniquely exposed sensitive and therefore potentially vulnerable to the impacts of climate change climate change may increase fire risk in forests surrounding communities it is also likely to affect timber supplies positively negatively or both thereby causing changes in local economic activity and increasing instability and uncertainty moreover these responses may be variable and nonlinear over time the vanderhoof experience with the mountain pine beetle *dendroctonus ponderosae* hopkins shows that climate change has the potential to affect natural capital near other forestbased communities reduction of the natural capital asset base supporting any community will ultimately result in negative socioeconomic impacts governments municipal provincial and federal could use the approaches described here to identify locations where natural capital is at greatest risk this information is needed to develop strategies for either protecting existing natural capital replacing lost capital or transforming exposed natural capital to alternative types of assets that are less sensitive to climate change
